Lip Repositioning: A novel surgical technique for Gummy Smile correction.

Aymen Elatrash ,BDS, MSc(OMFS)
Oral & Maxillofacial Surgery Department
School of Dentistry – Benghazi University

Excessive gingival display commonly referred as a “gummy smile,” can be a source of annoyance for some patients. Excessive gingival display has several possible etiologies. Esthetic crown lengthening, orthodontic leveling of the gingival margins and orthognathic surgery are used to be the possible modalities for Gummy smile correction. The presentation will describe a novel surgical technique for lip repositioning to minimize the display of the gingiva particularly in smiling for more esthetic enhancement.
